Connect Modbus RTU Servers to BACnet/IP Client

The 460MMBS moves data between up to 32 Modbus RTU Servers and a BACnet/IP Building Automation System (BAS).
It's the perfect tool that allows you to use the plethora of Modbus RTU devices available in your BACnet/IP Building Automation Systems.

How Do I Use the 460MMBS-N34 in My Application?

Modbus register data is mapped to BACnet analog objects and Modbus coil data is mapped to Binary objects. The only additional piece required for BACnet is adding metadata which is nothing more than an ASCII description of each object.
No other deep understanding of either protocol is required to configure the gateway.
It really is that simple.

Why Use Real Time Automation as a Gateway Supplier?

While there are certainly other companies offering protocol gateways, there is no one who provides the level of support and service that you receive from RTA.

When you call, a live person answers the phone. When you talk with sales, you will get honest answers and recommendations. When you get support, it is from an engineer who had a hand in the product's development, and support doesn't require a ticket or 24-hour wait.
